Overview & Motivation

ML Platform overview

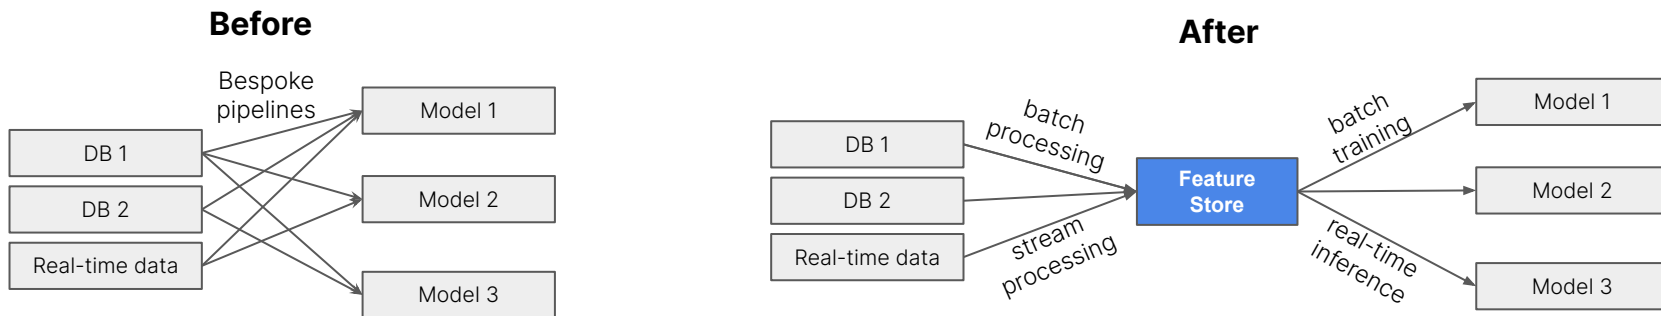

Democratize & accelerate scalable ML development across Disney Streaming

Why do we need a Feature Store?

Improve feature creation (Data Engineers) and feature consumption (Data Scientists) for various ML use cases

- **Break-up bespoke** pipelines
- **Decouple** feature engineering from model development
- Support **various computing environments**
- **Discover & share** features

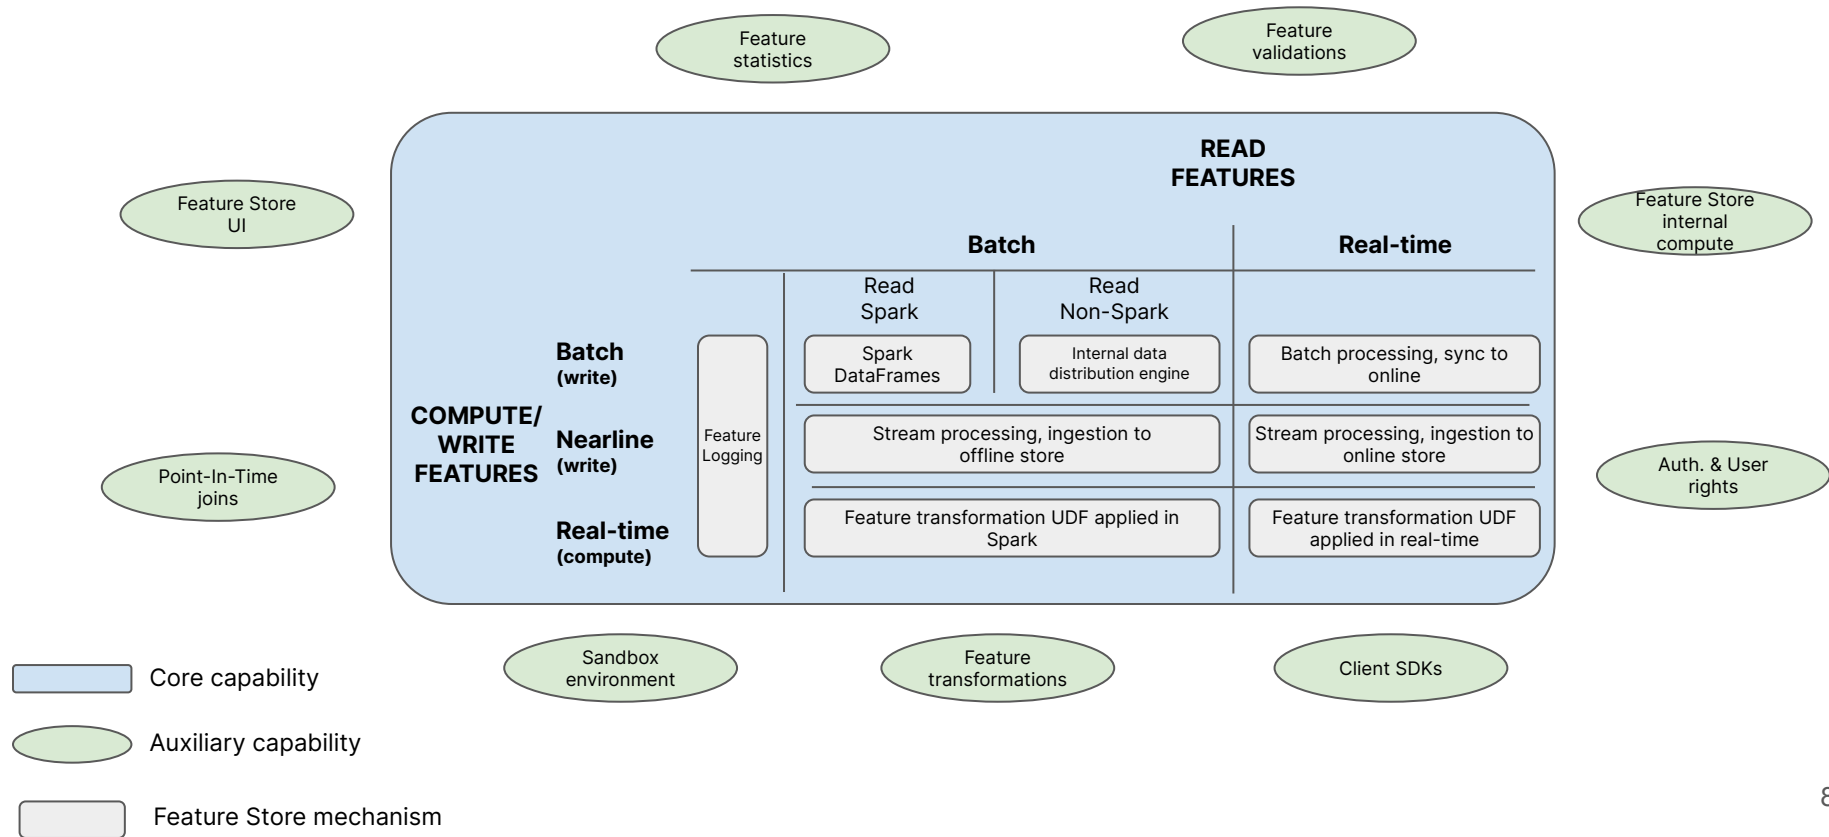

Why do we need to build our own Feature Store?

- Global scale batch training & scoring
 - **Region-specific** data
 - Focus on **experimentation**
 - Feeding **multiple datasets** – not just “one training dataset”
 - Bridge between **Spark based dataprep** and **single-node training & scoring**
- Customized data model
 - **Compatibility** with larger ML platform
- Existing ML-platform infrastructure and teams

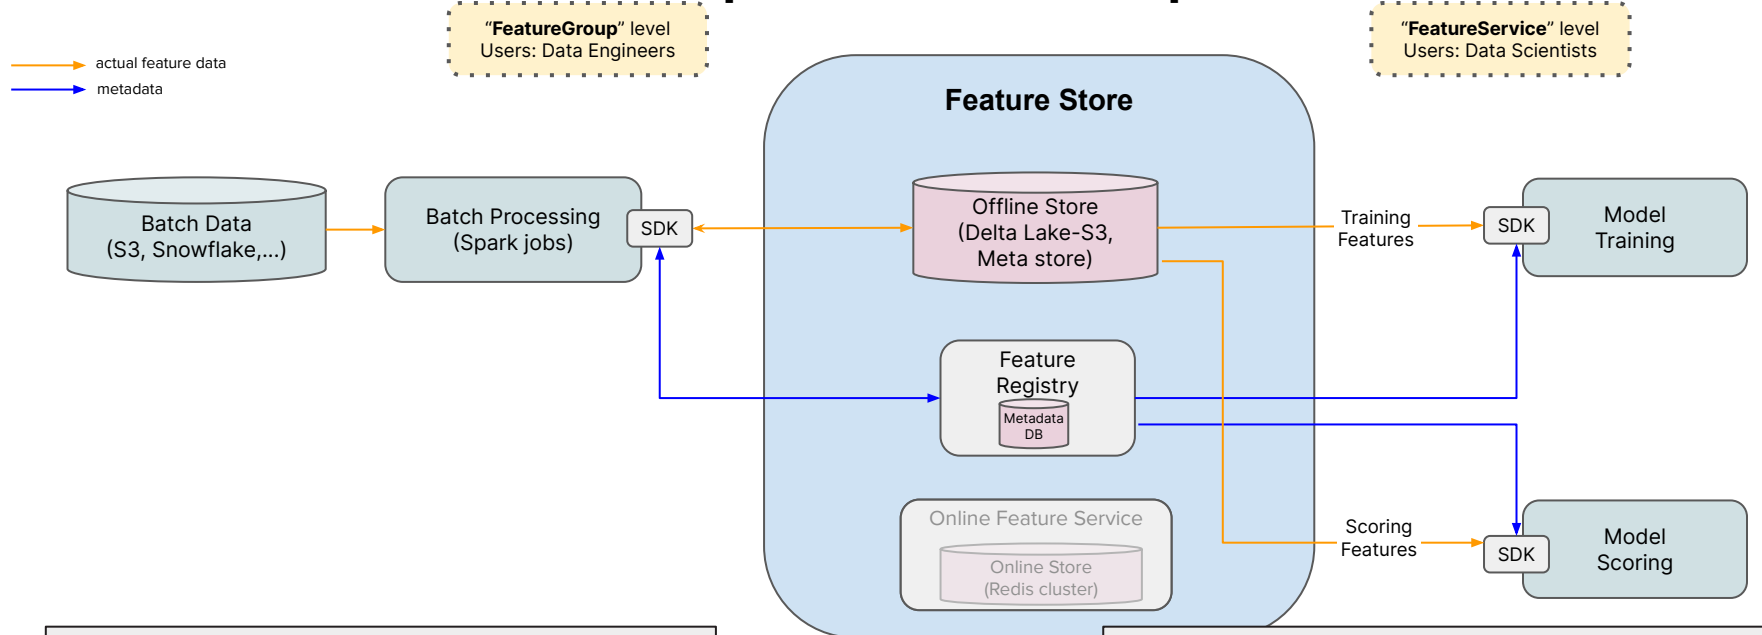

Nexus Feature Store Capabilities

Nexus Feature Store capability map

Nexus Feature Store Architecture

Nexus FS Architecture - Spark write & Non-Spark read

Write

- get **FeatureStore**
- get **FS.FeatureGroup(s)**
- create **FS.FeatureService**
- ingest data from one or many **FeatureGroups** to a **FeatureService**

Read

- get **FS.FeatureStore**
- get **FS.FeatureService**
- load subsets of data from **FeatureService** (e.g sub-sampled, sub-partitioned etc.)

Nexus FS Architecture - Streaming write & real-time read

 actual feature data
 metadata

Write

- get **FeatureStore**
- get **FS.FeatureGroup**
- ingest streaming data to online (& offline) **FeatureGroup**

Read

- get **FeatureStore**
- get **FeatureGroup(s)**
- Define **FeatureGroup** joins in a **QueryPlan**
- Create **FeatureService** and save **QueryPlan**
- Get **FeatureVector** in milliseconds from **FeatureService** by passing primary-keys from real-time request

Thank you!
